

2003

Silvicultural Activities Report

including Annual Report on Clearcutting and Precommercial Activities

Compiled from the 2003 Landowner Reports and other survey instruments.
Data collected under the provisions of Title 12 MRSA §8885 and §8878-A

Report Highlights

Harvesting and Land Use Changes

- 511,070 acres were harvested in 2003, a 9% decrease from 562,745 acres in 2002. Most of the decline in harvest acreage occurred on non-industrial lands.
- 481,315 acres were partially harvested in 2003, a 11% decrease from 539,225 acres in 2002.
- The number of harvests reported declined 9% from 5,150 to 4,743 harvests.

Clearcutting:

1. The total area clearcut increased, from 18,389 acres in 2002 to 24,021 acres in 2003. Clearcutting amounts to less than 5% of total harvested acres.
2. Landowners owning more than 100,000 acres in Maine created 96% of all clearcuts (22,953 acres).
3. Average clearcut size in 2003 was 25 acres. Landowners owning more than 100,000 acres had an average clearcut size of 27 acres. Landowners owning less than 100,000 acres had an average clearcut size of 13 acres. Two clearcuts larger than 75 acres were created in 2003.
4. The primary silvicultural reasons for clearcutting reported by large landowners were: (a) Removal of stands that, if partially harvested according to accepted silvicultural practice, are at high risk for windthrow due to factors such as soils, rooting depth, crown ratio or stem quality; (b) For areas where the retention of the residual overstory trees were at high risk of windthrow.

Land Use Changes:

- Harvesting to convert land from forest management to some other land use increased 12% from 5,131 acres in 2002 to 5,734 acres in 2003.

Precommercial Silvicultural Activities

Herbicide Use:

- For site preparation decreased 35%, from 1,690 acres in 2002 to 1,093 acres in 2003.
- To release crop trees from competing vegetation increased 9%, from 17,070 acres in 2002 to 18,663 acres in 2003.

Timber Stand Improvement (TSI):

- Precommercial thinning of young stands with spacing saws increased 41%, from 19,089 acres in 2002 to 26,894 acres in 2003. 98% of this activity was done by landowners owning more than 100,000 acres.

Planting:

- Tree planting increased 36%, from 7,926 acres in 2002 to 10,746 acres in 2003. 84% of the planting was by landowners owning more than 100,000 acres. The predominant species planted were spruce species.

Professional Assistance

- The harvest acres supervised by licensed foresters declined slightly. 71% of all harvest acres in 2003 had a licensed forester involved, compared to 76% of all harvests in 2002. Licensed Forester supervision on small woodlots (<= 100 acres) declined slightly from 27% in 2002 to 25% in 2003.

Statewide total harvesting volumes reported in the 2003 Wood processor Report corroborate the data reported in this report that harvesting activities in Maine declined in 2003.

Definitions:

Ownership Type

Forest Industry Land: Woodlands owned by a forest products industry; usually most of the wood harvested is used by that industry.

Institutional Investor Timberlands: Woodlands owned by organizations that hold assets as fiduciaries for the benefit of others.

Non-Industrial Land: Woodlands privately owned but NOT by a forest industry. These include private individuals and other non-forest product industries.

Other woodlands: Woodlands owned by other entities not listed above -- including local, state, federal, or tribal governments.

Types of Harvests

Partial Harvest: Harvest where trees are removed individually or in small (<5 acre) patches.

Shelterwood: Harvest of mature trees from a forest site in two or more stages. The first stage removes only a portion of the trees to allow establishment of regeneration before the remaining trees are removed in subsequent harvest.

Clearcut: Harvest on a site greater than 5 acres that results in a residual basal area of acceptable growing stock trees >4.5" DBH of less than 30 square feet per acre, unless after harvesting the site has a well-distributed stand of acceptable growing stock 3 feet tall for softwood and 5 feet for hardwoods (Overstory Removal). Refer to the latest copy of the Maine Forest Practices Act, Maine Forest Service Rules Chapter 20 for additional information.

Change of Land Use: Harvest conducted to convert forestland to another land use such as house lots, farm pastures, etc.

Harvesting Trends in Maine 1998-2003

Purposes for creating clearcut:

1. Removal of poor quality, intolerant, under stocked, short lived or mature overstories where the retention of the residual overstory trees is not justified for further increase in value, as a source of seed, or for protection of the new stand.
2. Ecologically appropriate improvement or creation of wildlife habitat.
3. Removal of stands that, if partially harvested according to accepted silvicultural practice, are at high risk for windthrow due to factors such as soils, rooting depth, crown ratio or stem quality.
4. Harvesting of an existing plantation or other forest stand established by or previously treated with precommercial silvicultural activities.

Frequency Distribution of Clearcutting
