This report is intended to give a profile of timber prices in Maine. Values given are offered as a guide to help individuals assess the fair market value of their standing timber. The average price for a county should not be applied as the exact value for a particular tract. The best way for private landowners to obtain the most accurate stumpage values for a particular tract is to consult with a Licensed Forester prior to harvesting.

About the 2001 Stumpage Price Report

What is the purpose of this report?

This report lists the stumpage prices paid to Maine landowners during the calendar year 2001. This information is intended to give landowners a profile of timber prices in Maine.

How was this information collected?

The Maine Forest Service (MFS) collects information on timber harvesting through notification and landowner reporting. The price information contained in this report is based on approximately 3,300 landowner reports received by the MFS that reported having a stumpage sale in 2001.

What is the purpose of the Annual Landowner Reports?

Each year, the MFS collects information from forest landowners regarding the stumpage prices, volume of timber harvested, and harvest acreage in Maine.

This confidential information is used for three primary purposes:

- to calculate valuations for lands enrolled in the Tree Growth Tax Program,
- to publish stumpage price descriptive statistics, in a format which maintains landowner confidentiality, and
- to quantify harvest area and forest management techniques.

This report is arranged so you can look up stumpage prices by county. Stumpage prices are organized into eight product categories:

<u>Biomass</u>	<u>Pulpwood</u>
<u>Boltwood</u>	<u>Sawlogs</u>
<u>Firewood</u>	<u>Studwood</u>
<u>Palletwood</u>	<u>Veneer</u>

The statistics includes:

average stumpage price
minimum stumpage price
maximum stumpage price
number of reports used to calculate the average

Because the number of reports for individual products/counties varies widely comparisons with neighboring counties may be useful.

If there are three or fewer reports for a product and species in one county, the price statistics are not reported for that county, but are included on the State Summary page. Species not listed for a product indicate that no reports were filed reporting that product and species combination.

FACTORS INFLUENCING STUMPAGE PRICES OF FOREST PRODUCTS

Stumpage prices on a given timber harvest are influenced by a number of factors including but not limited to the following:

- Volume to be cut per acre or total harvest volume
- Average size of trees to be cut
- Mix of species to be harvested
- Percentage of pulpwood and sawlogs
- Timber quality
- Logging terrain
- Distance to public roads
- Type of logging equipment
- Time of year
- Landowner needs or special requirement
- Market demand
- Distance to market
- Property taxes
- Landowner knowledge of market value
- Sale by competitive bid
- Type of harvest: i.e., partial or clearcut
- Regulatory constraints

Any one of the above factors can have a significant effect on stumpage prices for a species, while another factor may have an insignificant effect in a particular area. Under certain circumstances reasonable prices may occur outside the given ranges within this report.

DEFINITIONS AND NOTES

Average: The average price (or mean) is calculated by multiplying the corresponding volume by their stumpage price for each species and product reported by woodland owners. These are added together and divided by the sum of all the volumes (reported with corresponding stumpage prices) for that product and species. This is a weighted average.

Biomass: Above ground portion of tree that is chipped on site, usually the whole tree but sometimes only the tops and branches.

Boltwood: A short log of a length suitable for manufacturing turned forest products (i.e. dowels, toothpicks) or peeling veneer.

Conversions: For converting different units of volume, a conversion table is shown on the last page of this report.

Cords (cds): (MFS Rules Chapter 20 definition). A cord is a unit of measure of wood products 4 feet wide, 4 feet high, and 8 feet long, or its equivalent, containing 128 cubic feet when the wood is ranked and well stowed. Any voids that will accommodate a stick, log or bolt of average dimensions to those in the pile shall be deducted from the measured volume.

Max(imum): The maximum price is the highest price reported.

(MBF) One thousand board feet. For stumpage purposes, MBF is usually determined based on log scale, not on actual recovery of lumber. One (board foot) is a piece of wood 1" thick by 12" long by 12" wide.

Min(imum): The minimum price is the lowest price reported.

Palletwood: A low grade sawlog intended to be sawn into lumber for making pallets or landscaping ties.

Pulpwood: A log used to produce fiber for making paper. Though reported the MFS in three different units (cords, tons, and pounds), the stumpage price report converts pulpwood volumes to cords. For conversions, see back page of this report.

Reports (# of Rpts): The number of reports upon which the statistics were calculated. If there were three or fewer reports for a product and species in one county, the price statistics are not reported at the county level (to preserve confidentiality). There may be a statewide price however.

Sawlog: A log suitable for to the production of dimensional lumber.

Scale: The measurement of sawlogs, pulpwood, or other wood products, usually by a licensed Wood Scaler or scaling facility. Also a standard by which wood products are measured.

Species: **Other Hardwood**
basswood, hornbeam, grey birch, black cherry,
other oak species

Other Softwood
tamarack/larch, pitch pine, jack pine, etc.

Common Names for some species

Aspen: **poplar, popple**

Red Maple: **white maple, soft maple**

Sugar Maple: **rock maple, hard maple**

White Birch: **paper birch**

Studwood: Small sawlogs intended to be sawn into small dimensional lumber.

Stumpage: The value of standing trees. (MFS Rules Chapter 20 Definition)
Typically, stumpage is the value paid by a contractor to the landowner for standing trees in the landowner's woodlot or a designated harvest area. Written (or occasionally verbal) contracts then assure the contractor (i.e. purchaser of stumpage) of the right to harvest and remove the trees, possibly with certain conditions relating to method of payment, timing of harvest, necessary improvements, and protection of other resources. Stumpage is often determined and paid based on measure, or scale, of the harvested wood's volume and quality, by a state licensed wood scaler or scaling facility.

Veneer: Wood peeled, sawn, or sliced into sheets of a given constant thickness.

Stumpage Prices paid to Maine Forest Landowners in 2001

This report is intended to give a profile of timber prices in Maine. Values given are offered as a guide to help individuals assess the fair market value of their standing timber. The average price for a county should not be applied as the exact value for a particular tract. The best way for private landowners to obtain the most accurate stumpage values for a particular tract is to consult with a Licensed Forester prior to harvesting.
