

MAINE DEPARTMENT OF
INLAND FISHERIES & WILDLIFE

Maine Bass Waters

Caring for Maine's Outdoor Future
www.mefishwildlife.com

Dear Angler:

Here is a list of some of the many waters in Maine that offer fine bass fishing. This list is by no means a complete listing of every water in Maine which contains bass, and is intended only as a guide to sportsmen wishing to take advantage of the excellent bass fishing Maine has to offer.

Following the listing is an article on bass management in Maine. We have also included a copy of our length-weight tables for smallmouth bass and largemouth bass. The tables are accompanied by a few brief paragraphs on bass fishing.

Have a nice bass fishing day!

Roland D. Martin
Commissioner
Maine Dept. of Inland Fisheries & Wildlife

SOMEONE'S STEALING MAINE'S FISHERIES

**Introduction of fish to any

Bass Management in Maine

Maine's bass resource is an extremely valuable asset for several reasons. First, bass are found in 613 lakes and ponds representing over 0.5 million acres of water in Maine. Secondly, although Maine's bass resource requires careful management to remain healthy, our bass populations are based on natural reproduction, that is, annual stocking programs are not required. Third, while most of bass waters are, as yet, lightly fished, the popularity of bass fishing is growing rapidly in Maine and the fishery is becoming increasingly important to local economies.

Until the 1980s, Maine fishery biologists had utilized a 'laissez faire' approach to bass management. After all, bass maintain themselves through natural reproduction so the species can manage quite nicely on their own, can't they? Well, for many years, they did!

More recently, the increase in bass fishing effort and the results of the work of biologists in Ontario has led the Department to rethink this philosophy. Basically, the work of the Ontario scientists indicates that black bass in the northern part of their range are susceptible to climate-induced year-class failures.

Furthermore, bass are slow-growing in Maine waters so it takes many years for a bass to reach desirable size and there are not very many "trophy-size" bass in a given lake. For example, in eastern Maine, a 12-inch bass is usually 6 years old, and bass from 15-20 inches long can be up to 20 years old! These biological facts are complicated by the fact that Maine anglers preferentially seek larger bass, the very fish that are few in number, and that when removed, take a long time to replace. Clearly, size quality in many Maine bass populations is likely to decline when fishing pressure, and removal, is high.

So the Department's fishery biologists set out to devise a management approach that would preserve size quality in most Maine lakes and restore it where it has degraded. After long, sometimes heated discussions, the Department promulgated a 12 inch length limit for all but northern and eastern Maine and 1 fish bag limit for the period January 1 through June 20. A 3 fish bag limit, only 1 of which can exceed 14 inches, was established for the remainder of the open water season. Dire predictions to the contrary notwithstanding, the changes were well received by the public. In the intervening 9 years the general law regulations have changed somewhat and special regulations have been adopted for a few individual lakes but all in all our new bass management philosophy has not changed.

Presently Maine's bass resource is in good shape and is highly rated on a national level by knowledgeable anglers. With continued vigilance by fishery managers and continued cooperation by anglers, it promises to remain so.

*by Rick Jordan, Fisheries Biologist and
Dennis McNeish Fisheries Management Supervisor*

SMALLMOUTH BASS

(Micropterus dolomeui)

The smallmouth bass is one of Maine's most valuable sport fish. Originally, smallmouths were distributed in the St. Lawrence, Ohio, Tennessee, and upper Mississippi rivers, and in the Great Lakes. The smallmouth bass is not native to Maine, being first introduced into the state in 1869. Cochnewagon Pond, Phillips Lake, and Cobbosseecontee Lake were among the first waters to receive smallmouth bass. Since then, there have been many additional introductions. Smallmouth bass are now present in 432 lakes comprising 485,471 acres.

Smallmouth bass thrive in lakes and ponds with clean, fertile water. Smallmouths also do well in Maine's rivers and streams. Suitable shoreline gravel for spawning, and rock rubble for cover are important features of good smallmouth habitat. Stable water levels are also important.

Male smallmouths mature at 3 to 5 years of age, while females mature at 4 to 6 years of age. Size at maturity ranges from 8 to 12 inches. Parental care is highly developed, with nest construction and protection of eggs and fry practiced by the male only. The male smallmouth begins nest construction when water temperatures approach 60° F. A bed of coarse gravel is selected with some protection preferred, such as an overhanging tree or large boulder. Water depths may range from 10 inches to 12 feet. Spawning usually takes place when water temperatures are between 59° F and 65° F. The eggs are adhesive and attach themselves to the gravel. After spawning, the female leaves and may spawn in another nest with another male. The male remains to guard the eggs and young. A few days after hatching, the fry begin to darken and rise from the gravel as "black fry". Gradually the young bass move farther away from the nest to feed and seek cover in the form of piled stones, woody debris, or vegetation. Young bass begin to feed on plankton and small insects, and gradually shift to fish and crayfish as they increase in age and size.

Weights of Maine Smallmouth Bass

LENGTH (in.)	WEIGHT (lb-oz)	LENGTH (in.)	WEIGHT (lb-oz)
12	0—13	17 1/8	2—6
12 1/8	0—14	17 1/4	2—7

LARGEMOUTH BASS

(Micropterus salmoides)

Largemouth bass were originally distributed in waters of southern Canada, the Great Lakes drainage, the Mississippi Valley, northern Mexico, Florida, and the Carolinas. Its range has been gradually extended northward into New England and waters west of the Rockies to California. The first largemouth introduction in Maine probably occurred incidentally with planned introductions of smallmouths in the mid-1800s. The first recorded largemouth introduction in this state was in Forbes Pond, Gouldsboro in 1897. Some of the first large lakes in which largemouths became firmly established were Great Pond and Messalonskee Lake, both in the Belgrade Lakes Region. Today, largemouth bass are found in about 246 lakes comprising about 154,000 acres.

Although largemouth bass occur in a variety of habitats in Maine, they thrive in the shallow, weedy areas of our most productive lakes, and sluggish rivers and streams. This species grows best in waters that have average summer temperatures in the high seventies.

Spawning habits of largemouth bass are similar to those of smallmouth bass. Largemouth bass spawning behavior is initiated in late spring and early summer as water temperatures exceed 60° F. The nests of largemouth bass are usually less elaborate than those of the smallmouth. They may be found at depths of from one to three feet on a mud bottom, often at the base of old stumps and submerged plants. Largemouths will also spawn along gravel shores. The male largemouth remains near the nest for several weeks, during which time he guards the eggs and fry. A few days after hatching, schools of young largemouths may be found among aquatic vegetation, which affords them protection from predators and other hazards. Young largemouths feed largely on plankton and small insects. As they become larger, they feed on crayfish, frogs, and small fish.

Weights of Maine Largemouth Bass

LENGTH (in.)	WEIGHT (lb-oz)	LENGTH (in.)	WEIGHT (lb-oz)

Accessing Private Land: It's a Privilege

Whether you are a hunter, angler, snowmobiler, or one of the many other outdoor recreationalists, everyone must work with all private landowners.

Remember, your actions reflect not only all hunters and anglers but anyone who wants to access private land for outdoor recreational use.

LOONS & LEAD DON'T MIX

Lead tackle is deadly to waterbirds!

Lead sinkers and jigs cause fatal lead poisoning in loons and other waterfowl.

Lead ingestion is the #1 killer of loons in Maine, but any waterbird can die from swallowing just one lead sinker or jig!

YOU CAN:

Use steel, tin, bismuth, or plastic instead. Ask local tackle shops to stock alternatives. Properly dispose of old lead sinkers and jigs.
