SURFICIAL MATERIALS

Quadrangle Location
Scale 1:24,000
Contour Interval 10 feet

True North

This map shows the locations of surficial materials on the ground level, independent of bedrock exposures in the area. The surficial materials shown are those that occur at or near the soil surface or in near-surface deposits that are exposed to weathering and erosion processes.

This map is based on a variety of data sources, including field observations, aerial photography, and geologic maps. The surficial materials are classified according to their origin, texture, and composition, and are shown on the map using different symbols and colors. The map also includes a legend that explains the symbols and colors used to represent the various surficial materials.

The map is intended to provide a general overview of the surficial materials in the area, and is useful for planning and development activities, as well as for educational purposes. The map can be used to identify areas with specific surficial materials, and to understand the potential impacts of these materials on the environment and human activities.
