Surficial Materials

Winthrop Quadrangle, Maine

SURFICIAL MATERIALS

Geological materials such as surficial and marine bedrock deposits form the surface of the Earth, and the materials found between the bedrock and the surface. These materials include soils, sands, gravels, and other deposits that are the result of weathering, erosion, and deposition. Surficial materials are mapped using various techniques, including aerial photography, remote sensing, and field mapping. The Surficial materials map of the Winthrop Quadrangle, Maine, shows the distribution and characteristics of surficial materials in the area.

The map shows the location of surficial materials in the quadrangle, including:

- Surficial materials such as soils, sands, gravels, and other deposits
- Bedrock materials
- Marine bedrock deposits

The map also includes:

- A scale in feet and kilometers
- A contour interval of 10 feet
- True North

This map is useful for understanding the distribution and characteristics of surficial materials in the Winthrop Quadrangle, Maine, and can be used for various purposes, including planning, engineering, and environmental studies.

SURFACE MATERIALS

Surface materials such as surficial and marine bedrock deposits form the surface of the Earth, and the materials found between the bedrock and the surface. These materials include soils, sands, gravels, and other deposits that are the result of weathering, erosion, and deposition. Surficial materials are mapped using various techniques, including aerial photography, remote sensing, and field mapping. The Surficial materials map of the Winthrop Quadrangle, Maine, shows the distribution and characteristics of surficial materials in the area.
