Bedrock Well Yield

**Explanation**

Well yield in gallons per minute:
- 0–1 gpm
- 1–2 gpm
- 2–4 gpm
- 4–6 gpm
- 6–8 gpm
- 8–10 gpm
- 10–15 gpm
- 15–20 gpm
- 20–25 gpm
- 25–50 gpm
- 50–100 gpm
- >100 gpm

**Yield of Bedrock Wells**

Bedrock wells in Maine are rated for a total yield of water. The yield of water from each well is measured and categorized into one of the following yield classes: 0–1 gpm, 1–2 gpm, 2–4 gpm, 4–6 gpm, 6–8 gpm, 8–10 gpm, 10–15 gpm, 15–20 gpm, 20–25 gpm, 25–50 gpm, 50–100 gpm, and >100 gpm. The yield class is determined by measuring the rate at which water can be extracted from the well, typically measured in gallons per minute. The yield class helps to assess the potential usefulness of the well for various purposes, such as irrigation or water supply, and can guide decisions on well site selection and well construction.
