SURFICIAL GEOLOGY OF MAINE

A surficial geology map shows the distribution of various types of surficial deposits over an area. The map includes information on glacial, glacially modified, and non-glacial deposits. Glacial deposits are shown in different colors to indicate their origin and age. Glacially modified deposits are also color-coded to represent different types of modification. Non-glacial deposits are mapped in a different color to distinguish them from the glacial deposits. The map is useful for understanding the geological history of an area and for planning land use and development.
