SARTIFICAL MATERIALS

Glossary of terms used in the following sections:

Ablution till: Deposited during retreat of the late Pleistocene.

Refusal: In test boring or well.

Relative Abundances: Uncertain (e.g., st-c).

Superposition: Stardard.

Surficial Materials: Deposited overlying glacially eroded bedrock. Dark streaks on the rock face are wet areas. Photographs show thin layer of till overlying glacially eroded bedrock. Dark streaks on the rock face are wet areas.

MAPS AND SOURCES OF RELATED INFORMATION

Base map features from Maine Office of GIS - 1:24,000 USGS contour lines. Map units mean. Note especially the photos at the bottom of the page. Gravel over sand over gravel: p-c/s/p-c.

Lake at lower end of Bear River valley, Newry.

Drilled overburden well.

Ablution till: Deposited during retreat of the late Pleistocene.

Refusal: In test boring or well.

Relative Abundances: Uncertain (e.g., st-c).

Superposition: Stardard.

Surficial Materials: Deposited overlying glacially eroded bedrock. Dark streaks on the rock face are wet areas. Photographs show thin layer of till overlying glacially eroded bedrock. Dark streaks on the rock face are wet areas.
