THE QUESTION OF FEEDING.

In recent years a question has arisen among farmers and dairymen as to the amount of hay to be fed to milch cows to secure the largest yield of milk, or how much can be profitably fed.

Some farmers omit the noon feed, claiming that more milk is secured thereby. To deprive the cow of the amount of hay which the appetite demands, unless the deficit is made up by an increased amount of grain, seems the height of folly.

Let us inquire what are the natural habits of the cow when turned out to pasture and left to her natural inclinations. She satisfies her appetite once and always and it is rare indeed that she will eat more than she needs.
