Asthma is a chronic disease that affects the lungs and airways. Asthma causes wheezing, breathlessness, chest tightness, and coughing at night or early in the morning. There is no cure for asthma but it can be controlled with medication and by avoiding breathing in substances that irritate the lungs.

**Prevalence of Current Asthma Among Children, 2006-2010**

About 1 in 11 (9.3%) children under the age of 18 in the Cumberland District currently have asthma. This rate is not significantly higher than the Maine state rate. Although prevalence looks higher among males than females in both Cumberland District and the state, these differences are not statistically significant.

**Prevalence of Current Asthma Among Adults, 2006-2010**

One in 10 adults (9.1%) in Cumberland District reported having current asthma. This is not significantly different from the percent of Maine adults who reported having current asthma. Prevalence is significantly higher among females than males in both Cumberland District and the state.
Maine Center for Disease Control and Prevention Asthma Program Factsheet

**Adult Asthma Control, 2006-2010**

Asthma can be controlled with proper medication use, following a written asthma action plan, and avoiding triggers that make asthma worse. About half (51.9%) of Cumberland District adults have “well-controlled” asthma (based on their reports of symptoms, nighttime awakenings, and use of rescue medications). Although asthma control looks better among females than males in both the Cumberland District and the state, these differences are not statistically significant.

**Emergency Department Visits Due to Asthma, 2007-2009**

Each year, about 1,471 emergency department (ED) visits of Cumberland District residents are due to asthma. The age-adjusted ED visit rate is 56.4 per 10,000 population. This is significantly lower than the statewide rate. Females are significantly more likely than males to visit the ED because of their asthma in both Cumberland District and the state.

**Asthma Hospitalizations, 2007-2009**

Each year, asthma is the primary reason for more than 179 hospitalizations of Cumberland District residents. The age-adjusted hospitalization rate is 6.4 per 10,000 population. This is significantly lower than the statewide rate for the same time period. There are no significant gender differences in the asthma hospitalization rate in Cumberland District.
Between 1999 and 2009, 21 residents of Cumberland District died due to asthma. The age-adjusted death rate was 0.6 per 100,000 population (95% confidence interval 0.4 - 1.0). This rate is not significantly different from the statewide rate of 0.9 per 100,000.

**Technical Notes**

Age-adjusted rates are adjusted to the year 2000 United States standard population.

The Confidence Interval (CI) is a range of values within which we believe the underlying, true value will be included. Most often, a 95% CI is given, which means that there is a 95% chance the range given includes the true value. These intervals are represented as bands in the figures above. In general, if the CIs overlap, the numbers are not statistically different.

Asthma Control: Overall Level of Control is based upon 3 factors: symptoms, nighttime awakenings, and rescue medication use, each of which is a summary measure based upon respondents’ reports of frequency of symptoms, nighttime awakenings, and use of rescue medications. Briefly, all three components must be “well-controlled” in order to score an overall level of “well-controlled.”
