Asthma is a chronic disease that affects the lungs and airways. Asthma causes wheezing, breathlessness, chest tightness, and coughing at night or early in the morning. There is no cure for asthma but it can be controlled with medication and by avoiding breathing in substances that irritate the lungs.

**Prevalence of Current Asthma Among Children, 2006-2010**

One in 11 (8.9%) children under the age of 18 in the Downeast District has current asthma. This rate is not significantly different from the Maine state rate. Although prevalence looks higher among males than females in both the Downeast District and the state, these differences are not statistically significant.

Data Source: Behavioral Risk Factor Surveillance System

**Prevalence of Current Asthma Among Adults, 2006-2010**

One in 9 adults (11.1%) in the Downeast District report having current asthma. This is not significantly different from the percent of Maine adults who report having current asthma. Prevalence is significantly higher among females than males in both the Downeast District and the state.

Data Source: Behavioral Risk Factor Surveillance System
Asthma can be controlled with proper medication use, following a written asthma action plan, and avoiding triggers that make asthma worse. More than half (53.3%) of Downeast District adults have “well-controlled” asthma (based on their reports of symptoms, nighttime awakenings, and use of rescue medications). Asthma control is similar among females and males in Downeast District.

Emergency Department Visits Due to Asthma, 2007-2009

Each year, about 661 emergency department (ED) visits of Downeast District residents are due to asthma. The age-adjusted ED visit rate is 82.6 per 10,000 population. This is significantly higher than the statewide rate. Downeast District females are about 40% more likely than Downeast District males to visit the ED because of their asthma and about 23% more likely than Maine females overall.

Asthma Hospitalizations, 2007-2009

Each year, asthma is the primary reason for about 73 hospitalizations of Downeast District residents. The age-adjusted hospitalization rate is 8.3 per 10,000 population. This is not significantly different from the statewide rate for the same time period. In Downeast District, hospitalization rates among females and males are not significantly different.
Between 1999 and 2009, 10 residents of Downeast District died due to asthma. The 95% confidence interval of the age-adjusted death rate is 0.4 - 1.7 per 100,000 population. This rate is similar to the statewide rate of 0.9 per 100,000.

**Technical Notes**

*Age-adjusted rates* are adjusted to the year 2000 United States standard population.

*The Confidence Interval* (CI) is a range of values within which we believe the underlying, true value will be included. Most often, a 95% CI is given, which means that there is 95% confidence that the range given includes the true value. These intervals are represented as bands in the figures above. In general, if the CIs overlap, the numbers are not statistically different.

*Asthma Control*: Overall Level of Control is based upon 3 factors: symptoms, nighttime awakenings, and rescue medication use, each of which is a summary measure based upon respondents’ reports of frequency of symptoms, nighttime awakenings, and use of rescue medications. Briefly, all three components must be "well-controlled" in order to score an overall level of "well-controlled."
